

What should it cost?

With the arithmetic shown.

A public product map for ClosetAI — what works today, what was built this week and what does not exist yet — and a revenue simulator where every assumption says whether it is verified or a guess.

Tamara Muñoz Delgadillo · Universidad Iberoamericana

DEMO VIDEO closetai.lat/demo/semana-3

THE WEEK IN ONE LINE. I built the simulator to defend my price, and it told me something I did not want to hear: with my own base assumptions, one payment of 100 pesos makes **1,267 pesos a month**. The number is on the page, with every assumption labelled verified or guessed, because a pricing page that hides its arithmetic is just an opinion with a currency sign.

1 • The rubric, category by category

CATEGORY	PTS	EVIDENCE	\$
Build discipline before coding	1.5	Packet committed at 16:07 (<code>2679c14</code>); first line of code at 16:18 (<code>f226ac8</code>). Public history	2
UX planning and image-generated mockup	1.0	Wireframe with implementation notes, scope cut, and what changed between the wireframe and the build	3
Product spec and acceptance criteria	1.0	11 requirements, each with a checkable criterion and where it is tested	4
Architecture and tech stack clarity	1.0	Data flow, the double calculation, and why there is no AI on these pages	5
Working deployed product	2.0	<code>closetai.lat/product</code> and <code>/pricing</code> load with no session; 10 of 10 end-to-end tests pass against production	6, 10
Coding/build evidence	1.0	10 commits (min. 5) · 10 deployments (min. 2) · 6 coding-agent prompts (min. 5)	6–9
Testing and iteration	1.0	2 pricing tests required, 6 written · 3 software tests required, 5 written · each one watched failing on purpose · 5 defects and corrections documented	10–11
Human judgment and explanation	1.0	Two business decisions made by me before the plan; a privacy bug found in my own database and fixed; decision note, 240 words	2, 12, 14
Demo clarity	0.5	2:19 walkthrough recorded against production, narrated by me	13

Required features and coding tasks from the week overview

REQUIRED	WHERE IT IS
Product feature map	<code>/product</code> — 16 features in 5 groups, each with its plan and its real state
3 pricing tiers	<code>/pricing</code> — Free, Complete (100 MXN once), Top-up (49 MXN / 20 credits)
2 customer segments	Core 18–35 and 36+, calculated separately and summed
Revenue calculator	Monthly and twelve-month net, with cost and margin
Scenario toggle	Conservative / Base / Optimistic — changes conversion, never price
Assumptions table	15 assumptions, each marked verified (with source and date) or guess
Saved pricing scenarios	<code>pricing_scenarios</code> table; the public list shows what the server computed
Create <code>/product</code> page · create <code>/pricing</code> page · build calculator inputs · calculate monthly/annual revenue · save scenarios · display saved scenarios	All live, all tested against production
2 pricing logic tests + 3 software tests	6 and 5 respectively (§10)

2 · The plan, written before the code

Full text in `docs/SEMANA-3-PACKET.md`, committed 11 minutes before the first code commit.

Two decisions I made before the agent wrote anything

Both are business decisions, so they are mine, and they are written in the commit message:

- **The three plans are the ones I already decided** — free, 100 pesos once, and a credit top-up. The subscription does **not** become a plan; it lives inside the simulator as a scenario. Putting a price on the page is a claim; putting it in the simulator is a question, and a question is all I have.
- **The two segments are core 18–35 and 36+**, the profile of the one real conversation I had in Week 2. They are the only two I have any evidence about.

Problem

ClosetAI's price was decided, but nobody could check it. It lived in a private markdown table: no customer could see what each plan includes, and nobody could see whether the price covers what the product costs to serve. And the try-on **costs money every time** — about 0.075 USD per render. A bad price does not show up on screen; it shows up in the bank account.

User

Me, deciding with numbers instead of hope. Whoever evaluates ClosetAI, who should see the arithmetic rather than a claim. And the customer, who should see what is free forever and what is not.

What had to work by the end of the week

Both pages public, the map honest about what does not exist, the calculator recomputing live, the scenarios ordered, every assumption sourced, and saving writing to Supabase — with the arithmetic reproducible from what is printed on the page.

Scope cut — what looked good and was not built

LEFT OUT	WHY
Charging for new plans	Stripe already charges the Complete plan. Touching real money for a pricing exercise risks real money
Subscription as a live plan	Nobody has said they would pay for one
Accounts to save scenarios	The page is public, like <code>/research</code> . Saving is protected by a rate limit, not a login
A charting library	Three bars in CSS do the comparison and weigh nothing
36-month projection	Twelve months already forces a decision; beyond that is fiction with decimals
Churn modelling	With zero paying customers, a retention rate would be a number I invented and then believed

3 · UX concept

The wireframe was drawn before the build, and it carries its implementation notes inside the drawing.

/pricing — wireframe

5 · ESCENARIOS GUARDADOS — PÚBLICOS, SIN CUENTA

Se guarda lo que calcula el servidor, no lo que manda el navegador. Límite: 20 por hora por hash de IP; la IP no se guarda.

The wireframe of `/pricing` : plans with their cost, movable assumptions, the result beside them, where each number comes from, and the saved scenarios.

Why there is no image-generated mockup this week. The plan promised one, like Week 2's. On October 9 I tried all four of Gemini's image models and all four answered **429, quota exceeded**: image generation has no free tier and billing is not active on the account. The rubric asks for a mockup or a wireframe, so this is the wireframe — and the plan in the repository was corrected rather than left promising something that does not exist.

What changed between the wireframe and the live page

- **The conversion fields split in two**, one per segment. In the wireframe there was a single percentage for both; while building it, two segments with identical conversion made the comparison pointless. Now each segment has its own, and they start at the same value so the asymmetry is something you test, not something I assumed.
- **Each input got a slider and a number box**. The slider is for exploring, the box for typing an exact figure.

ClosetAI · Week 3 · Tamara Muñoz Delgadillo · closetai.lat

Page 4 of 19

- **The bar chart legend changed.** The wireframe labelled the bars by segment and by scenario at the same time, which read as if the bars were segments. On the page each bar is a scenario and the caption says it sums both segments.

ClosetAI

PRECIOS

Un pago. Y la cuenta completa.

Cada plan dice lo que cuesta servirlo, no solo lo que cuesta comprarlo. Y abajo puedes mover los supuestos tú misma: cuántas personas se registran, cuántas pagan, cuánto se prueban ropa. De los 12 supuestos que entran en la cuenta, 6 están verificados; los demás están marcados como lo que son.

PARA SIEMPRE

Gratis

\$0

El clóset digital completo, para siempre. Nunca se cobra por trabajo que ya hiciste.

- Clóset ilimitado, con catalogación por IA
- 3 outfits del día generados por IA
- Un try-on de muestra
- Notivo de estilo e investigación, sin cuenta

Nos cuesta ~0.01 USD por persona al mes. Catalogar una prenda cuesta ~0.0003 USD.

UN SOLO PAGO

ClosetAI Completo

\$100

Un solo pago, para siempre. La decisión de no cobrar mensualidad es deliberada.

- Estilista IA sin límite
- Avatar para probarte la ropa
- 30 créditos de try-on
- Qué te falta en el clóset, con recomendaciones de compra

Costo máximo comprometido por venta: 2.25 USD, si se usan los 30 créditos.

CUANDO SE TE ACABEN

Recarga de créditos

\$49

Para quien se acabó sus créditos y quiere seguir probándose ropa.

- 20 créditos de try-on
- No caducan
- Se puede repetir

Nos cuesta ~1.50 USD si se usan los 20 créditos.

The three plans, each with what it costs us to serve.

The feature map. Twelve features live, two built this week, two that say out loud that they do not exist yet.

5 · Architecture and stack

The design decision of the week: the sum is computed twice

Once in the browser, so the number moves while you move the slider. Once on the server, before saving. If someone edits the JavaScript and sends an income of a million, what gets stored is still the result of those assumptions. The screen asks; the server decides. A test proves it: with zero sign-ups, the saved income is zero no matter what the browser sends.

Why there is no AI on these two pages

It is a decision, not an omission. A number that changes every time you ask it cannot be used to set a price, it cannot be reproduced by whoever reads the page, and it would cost money per question. The pricing logic is 190 lines of TypeScript with its own tests.

PIECE	CHOICE	WHY
Framework	Next.js 16, App Router	Already in use; Server Components read the database with no API in between
Arithmetic	Plain TypeScript, one file	Tested in milliseconds; the same function runs in the browser and on the server
Chart	CSS <code>flex</code> + height	Three bars do not justify a library
Database	Supabase Postgres + RLS	Public read for content, writes only with the service key
Validation	zod	Same contract pattern as <code>/core</code> and <code>/research</code>
Tests	Vitest + Playwright	Logic in Vitest, the real site in Playwright
AI	none	See above

6 · GitHub commits — 10 this week (minimum 5)

HASH	WHEN	MESSAGE
2679c14	Oct 6, 16:07	docs: Build Discipline Packet and wireframe, before writing code

The public repository. The plan is the first commit of the week, and every commit carries a green CI run.

7 · Vercel deployments — 10 this week (minimum 2)

All Production, all Ready, with exact times read from Vercel.

WHEN	STATUS	WHAT WENT OUT
Oct 6, 16:07	● Ready	The packet and the wireframe
Oct 6, 16:18	● Ready	/product and /pricing , with the pages showing their “no data” notice until the migration ran
Oct 6, 16:19	● Ready	The end-to-end tests
Oct 6, 16:19	● Ready	The prompt log
Oct 6, 16:25	● Ready	Fix: the cached product map
Oct 6, 16:28	● Ready	Test and iteration evidence
Oct 6, 16:30	● Ready	Fix: the duplicated label on the free plan
Oct 6, 17:45	● Ready	The demo video page and the decision note
Oct 6, 17:49	● Ready	The packet source

WHEN	STATUS	WHAT WENT OUT
Oct 9, 17:09	● Ready	The demo video with my narration

8 · Supabase evidence

Two migrations, both applied with my explicit permission and both checked against the database rather than against the screen.

Migration 008 — the pricing tables

WHAT WAS CHECKED	RESULT
The SQL pasted into the editor is the one in the repository	sha256 84d7a474..., 14,182 bytes, identical
pricing_plans	3 rows
pricing_features	16 rows
pricing_assumptions	15 rows
pricing_scenarios readable with the public key	401 — it is not

Migration 009 — a privacy bug of my own, found this week

Answering the question “what data does your app ask for, and do you need all of it?” I checked my own database. Week 1's table, `core_outputs`, had been left with public read and a comment claiming the column with people's text “is protected in the view”. It was not true: with the public key — the one that travels inside every browser — the fifteen texts could be read in full. I proved it by making that request.

CHECK	BEFORE	AFTER
<code>core_outputs</code> with the public key	200, 15 texts readable	401
<code>core_outputs</code> with the service key (what the page uses)	200	200 — the page is unaffected
IP addresses stored for the hourly limits	Stored in full, with no deletion date	Salted hash, in <code>/core</code> , <code>/research</code> and <code>/pricing</code>
Privacy notice	Said nothing about either	Says both, at closetai.lat/privacidad

The rule this leaves written in the migration: **a table is opened to the public key only if every one of its columns is public**. If one is not, none of them are.

9 · Coding-agent prompts — 6 this week (minimum 5)

Full log in `docs/evidencia/PROMPT_LOG.md` . What matters in each one is not the instruction, it is the judgment attached to it.

1 · Two decisions before the plan

“This is what we have to do this week. Do it.”

Before a single line: two questions back, because they were business decisions, not the agent's. Which three plans, and which two segments.

MY JUDGMENT. The subscription stays out of the page and inside the simulator.

2 · The packet, before the code

“Write the Build Discipline Packet for /product and /pricing, with checkable acceptance criteria, and commit it before touching code.”

2679c14 at 16:07; first code at 16:18.

MY JUDGMENT. No churn modelling. It would make every number bigger and none of them truer.

3 · The arithmetic, alone and testable

“The maths goes in src/lib/precios.ts: a pure function, no React, no network, no AI. The browser and the server call the same one.”

190 lines, every constant with its row in `pricing_assumptions` .

MY JUDGMENT. No AI here. A number that changes every time you ask it is useless for a price.

4 · The pricing tests, watched failing

“Two logic tests: that a 100-peso sale keeps its margin even if all 30 credits are burned, and that optimistic $\geq$ base $\geq$ conservative. Break the code on purpose before trusting them.”

6 tests. Sabotage: render cost $0.075 \rightarrow 0.30$ turns the first red; optimistic factor $2 \rightarrow 0.2$ turns the second red.

MY JUDGMENT. One of the tests I asked for was wrong, and the code was right. I fixed the claim, not the code.

5 · The browser does not get to decide what is stored

“When a scenario is saved, the server recalculates and stores its own result. And the hourly limit must not store the IP”

Server Action with zod and a second calculation; `src/lib/ip.ts` with a salted hash, shared with `/core` and `/research` .

MY JUDGMENT. This came out of a question about my own data, not out of the assignment.

6 · Test against the real site

“Three software tests against production: that it loads, that it recomputes, and that what is saved is the server's number. And that /product does not mark everything as live.”

5 tests in `e2e/precios.spec.ts` , 10 of 10 across phone and desktop.

MY JUDGMENT. The map test requires features marked as *not built*. A map where everything is finished is advertising.

10 · Testing — 2 pricing tests required, 6 written; 3 software tests required, 5 written

Pricing logic (`src/lib/precios.test.ts`)

#	WHAT IT ASSERTS	RESULT
1	A 100-peso sale survives the worst case: 7.66 to Stripe, 42.46 of credits, 49.89 net per sale, margin $\geq$ 50%	● pass
2	Optimistic $\geq$ base $\geq$ conservative in net income, and the plan price does not change between scenarios	● pass
3	With nobody paying: income 0, commissions 0, and the month costs exactly what the free users cost	● pass
4	The year is twelve of the same typical month	● pass
5	The optimistic scenario cannot convert more than 100% of sign-ups	● pass
6	The total is the sum of the two segments, not a separate calculation	● pass

Software, against production (`e2e/precios.spec.ts`)

#	WHAT IT ASSERTS	RESULT
1	<code>/pricing</code> loads with no session, with 3 plans, both segments, and an assumptions table that shows <i>both</i> verified and guessed	● pass
2	Raising an assumption raises the income; conservative lowers it; optimistic raises it again	● pass
3	What is stored matches the screen, and <code>ip_hash</code> is 64 hex characters	● pass
4	With zero sign-ups the stored income is zero: the browser does not dictate the result	● pass
5	<code>/product</code> does not mark everything live, and every route it marks live returns 200	● pass

10 of 10 across both profiles — phone and desktop — on October 6, 2026.

Re-verified on submission day, October 9: 56 unit tests green, and the production suite run three times. The first run had one red — the phone profile of test 1 — and the next two were 10 of 10. It ran two minutes after a deployment, so a cold start is the likely cause, but I did not prove it, so it is written here as what it is: one unexplained red on the first of three runs.

Each new test was watched failing, for the right reason

A green test proves nothing until you have seen it go red. Raising the try-on cost from 0.075 to 0.30 USD turns test 1 red with `expected 169.83 to be close to 42.46`. Dropping the optimistic factor from 2 to 0.2 turns test 2 red. Both go green again on revert.

Full suite

56 unit tests pass (6 new). End-to-end against production: 77 pass, 3 skipped by design, and **1 red** — the stylist test that builds three outfits. Run alone, it passes. It is the same intermittency recorded since September 18, still without an identified cause. It is written here rather than hidden.

11 · Iteration log — what changed after testing

WHAT WAS FOUND

My own plan asked for a false test: “0% conversion $\Rightarrow$ income 0 and cost 0”

A test I asked for was wrong: it claimed income per buyer is identical across scenarios

`/product` kept showing “not available” with the tables already created and verified

The free plan card read “Gratis / Gratis”

Asking what data ClosetAI collects: public read on `core_outputs`, and full IP addresses stored with no deletion date

WHAT CHANGED

Free users cost ~ 0.01 USD a month, so a month with no sales is -98 pesos, not zero. The test now fixes the real model

The scenario also changes how many top-ups each buyer makes. The claim was corrected; the code was right

It had been prerendered before the migration with a 5-minute cache. Now it reads on every visit, like the other public pages

The price now shows “\$0 · para siempre”

Migration 009, a shared salted-hash helper, and a privacy notice that now says both

12 · What the simulator actually says

This is the part I did not plan for: the tool I built to defend my price is the one that questioned it.

The simulator with my base assumptions: 400 sign-ups a month in the core segment, 120 in 36+, 3% buying the Complete plan, 8% buying a top-up, 6 credits used a month.

SCENARIO (520 SIGN-UPS A MONTH)	NET PER MONTH	OVER TWELVE MONTHS
Conservative — half the conversion	\$571 MXN	\$6,852 MXN
Base — my assumptions as written	\$1,267 MXN	\$15,206 MXN
Optimistic — double the conversion	\$2,741 MXN	\$32,892 MXN
If only 1 in 100 pays	\$357 MXN	\$4,284 MXN

Even tripling sign-ups to 1,200 a month in the core segment, the base scenario reaches \$3,217 a month and the optimistic one \$6,958. The margin is healthy — around 85% — because the product is cheap to serve. The problem is not the margin. **It is that one payment of 100 pesos, paid once per customer forever, does not add up to a business at this scale.**

What I am *not* doing with that: switching to a subscription this week because a spreadsheet told me to. The simulator uses guessed conversion rates — they are labelled as guesses on the page — so what it proves is not “subscriptions win”. It proves that the question is worth real evidence, and that evidence is a conversation with someone aged 18 to 35, which is the next one.

De dónde sale cada número

Lo verificado y lo supuesto no se mezclan. Es la misma regla de la página de investigación.

SUPUESTO	VALOR	DE DÓNDE SALE	ESTADO
Precio del plan Completo	100 MXN, una sola vez	Decisión de producto del Documento Maestro \$2.3; es lo que cobra Stripe hoy	verificado
Precio de la recarga	49 MXN por 20 créditos	Decisión de producto del Documento Maestro \$2.3	verificado
Costo de un try-on	0.075 USD por render	Tarifa publicada de FASHN v1.6 en fal.ai fuente	verificado
Costo de catalogar una prenda	0.0003 USD	Gemini 3.5 Flash-Lite, medido al construir el clóset	verificado
Comisión de Stripe México	3.6% + 3 MXN, más IVA	Tarifas de Stripe México fuente	verificado
Tipo de cambio	18.87 MXN por USD	Se mueve todos los días. Aquí está fijo para que la cuenta sea reproducible	supuesto
Lo que cuesta un usuario gratis	0.01 USD al mes	Estimación del Documento Maestro \$2.3, no medida con usuarios reales	supuesto
Registros nuevos al mes	400 en el núcleo, 120 en 36+	Supuesto. ClosetAI no ha hecho campañas: no hay dato propio todavía	supuesto
Cuántos compran el plan Completo	3% de quien se registra	Supuesto. Ninguna persona ha pagado todavía	supuesto
Cuántos compran una recarga	8% de quien ya pagó, cada mes	Supuesto. Ninguna persona ha comprado créditos todavía	supuesto
Créditos usados al mes	6 por persona de pago	Supuesto. La conversación de la Semana 2 habló de 40 prendas, no de créditos	supuesto
Qué modela el simulador	Un mes típico, repetido 12 veces	Decisión: no se modela retención ni abandono porque no hay un solo cliente de pago del cual aprenderlos	verificado

Contexto que no entra en la cuenta

Ingreso por afiliados: No se cuenta supuesto

Amazon México paga 10% en moda, pero ClosetAI no ha generado una sola venta: contarlos sería inventar ingreso [fuente](#)

Tamaño del mercado: 77 M de compradores digitales en México; 59% compra ropa verificado

AMVO, vía Milenio. Verificado en la investigación de la Semana 2 [fuente](#)

Qué funciona en la categoría: Stylebook lleva 17 años con un pago único de 4.99 USD; Style DNA factura ~3 M USD al año con suscripción verificado

Investigación de la Semana 2

Where each number comes from. Verified ones carry a source and a date; the rest say plainly that nobody has paid yet.

13 · Demo video

2:19, recorded against the live site, hosted on the product's own domain: closetai.lat/demo/semana-3, narrated by me.

How the narration was synchronised: I read the script against the silent recording, and before mixing, the timing was checked two ways — the audio's energy envelope and a timestamped transcription. Nine of the ten blocks land within two seconds of their scene; the simulator line runs four seconds early. The recording was not cut: re-timing block by block would have pushed the rest further from their marks than leaving it whole.

In order: the product map with no account; the sixteen features and their real state; the three plans with their cost; the simulator and its two segments; an assumption moved live and the income moving with it; the three scenarios compared; the assumptions table; saving a scenario; the public list; and the commit history in GitHub.

The first screen of the video: closetai.lat/product.

14 · Human decision note

This week I had to put a price on my product, and the honest answer was that I don't know yet what people will pay.

So I made a decision: the three plans on the page are the ones I already decided — free, one payment of 100 pesos, and a credit top-up — and the subscription stays out. It lives inside the simulator as a scenario instead. The evidence cuts both ways: Stylebook has lived seventeen years on one payment, Style DNA makes about three million dollars a year on subscriptions, and the only real person I interviewed already pays monthly for Disney+. Putting a price on the page is a claim. Putting it in the simulator is a question, and I only have a question.

I also rejected modelling customer retention. I have zero paying customers to learn a real rate from. The simulator models one typical month and says so on the page.

The number I did not expect: with my base assumptions, 520 sign-ups a month and 3% paying, ClosetAI makes 1,267 pesos a month. If only 1 in 100 pays, it's 357. That is what one payment of 100 pesos really means, and why the subscription question matters more than I thought.

Finally, I corrected myself. Asking what data my app collects uncovered that anyone could read what people wrote on my style page, and that I was storing full IP addresses. Both are fixed.
